Statistics can be a powerful tool for decision-makers at every level of society. They allow for evidence based planning and evaluation.

Today Timor-Leste is able to make use of high level, credible and up to date statistics provided

by the Direcção Nacional de Estatística from the Ministry of Finance, through its latest publication, the Timor-Leste Survey of Living Standards 2007.

Over the last few months the current government has been implementing a set of national priorities covering:

1. Public Safety and Security
2. Social Protection and Solidarity
3. Addressing the Needs of Youth
4. Employment and Income Generation
5. Improving Social Service Delivery
6. Clean and Effective Government

This statistical abstract provides much of the information needed to enable policy makers to address these priorities, but the survey itself provides even more, details which will be of particular use to sectoral experts. I encourage the members of the Government and Parliament and other interested stakeholders to participate by appointing expertise to delve further into this wealth of statistics.

In 2001, statistics gathered from the Living Standards Timor-Leste gave us the roots for the production of the first National Development Plan of Timor-Leste. The new Government will soon commence work on the next National Development Plan and this process will be no different. Already the experts are working on the Poverty Estimates, Profiles and Assessment. These will not only give us the evidence we need to formulate the second National Development Plan of the country but also the indicators which will be used to measure and monitor its success.

This survey is already being used for the MDG Poverty Reduction Report. It will also contribute to the update of the next Human Development Report (UNDP) and the Consumer Price Index (CPI) of the country.

The TLSLS07 provides an objective view of how the Timorese people are fairing in their daily lives. The challenge for this Government now is how to take this statistical information and transform it into a realistic action plan.

This Report allows for comparisons with the same survey taken in 2001, and allows us to measure our progress. The Report shows that we still have a long way to go towards our vision of our country, but there have been improvements.

We call on all our development partners, other development stakeholders, and the society at large, to base their development programs on this official national data. Thus, assuring that all government and donor programs alike are based on the same platform of information.

When one looks over the past few years and the next few years to come, one thing is certain: **it is possible to achieve the best practice plans in Timor-Leste.** However, this can only be done if we plan the work, and work the plan, and subsequently this can only be achieved with official credible national statistics and evidence-based planning.

It is important that policy makers, planners, political parties and community leaders are aware of the needs and aspirations of the people of their country in order for them to effectively provide for the specific needs of their population. Similarly, we, the Government, need to be aware of our country's demographic structure and socio-economic characteristics in order to plan for an adequate standard of living, and for the proper provision and distribution of goods and services to the people of Timor-Leste.

A handwritten signature in blue ink, which appears to read 'Emilia Pires'.

Emilia Pires
Minister of Finance

8 July 2008

Preface

This initiative was two years in the planning and drafting, putting together the right team and the proper conditions, so that we could in some way measure our development over the first few years of nationhood. Fortunately, we now have a reference point.

In 2001, the first report on poverty and living standards titled “Poverty in a New Nation: Analysis for Action” was published. This report was the outcome of three data collection activities: a Suco Survey, a Participatory Potential Assessment and a Living Standards Measurement Survey (TLSS). This effort was supported by several donors.

The TLSS 2001 reached 1,800 households over a period of three months. In 2007, that same household survey was extended to almost 4,500 households over a period of twelve months. The Timor Leste Survey of Living Standards (TLSLS) 2007 is a government-implemented activity with support from the multi-donor Planning and Financial Management Capacity Building Program (PFMCBP) managed by the World Bank.

Given the challenges facing us since 2006 due to the conflict, the change in government and the unsettled situation across all sectors, it became imperative to have an idea of the current conditions of our people. But this should be from their perspective, from their personal opinion, from their reality.

It is hoped that with this report, ahead of the poverty profile report which is expected to be released in the coming months, the various sectors of the government, civil society and the donors at large take a close look at some of the signs contained herein.

It is not the job of this report to explain or evaluate the findings from the survey, but merely to illuminate and prepare us all for what is happening in our country, in the urban and rural environments and how our people are being affected by the shifting reality that faces Timor Leste as it develops.

Our visiting experts have left behind several edicts to the quality of our work for which our Core Team at the Directorate of National Statistics (DNE) stands to be congratulated. They have stood up to the test and proved their worth and have done an outstanding job.

The TLSLS 2007 is considered to be of a high standard and quality comparable with some of the best such surveys in other countries. The data were entered in the field and quality controls were actively applied. This procedure saved us months of work and has allowed us to have access to the data for analysis with greater speed and accuracy. Most importantly, this was all possible through a small DNE Core Team, well-trained, dedicated and motivated to prove that they could do it. They were supported by a visiting team of four experts and one facilitator. We stand and applaud our Core Team and continue to support them with our commitment.

Introduction

This Final Statistical Abstract presents key tabulations from the 2007 Timor-Leste Survey of Living Standards (TLSLS) that concluded its field operations in January 2008. The Final Abstract follows an Interim Statistical Abstract of September 2007 which presented early findings from the TLSLS based on a little over half of the full sample representing data from households who were surveyed up to the end of June 2007.

TLSS

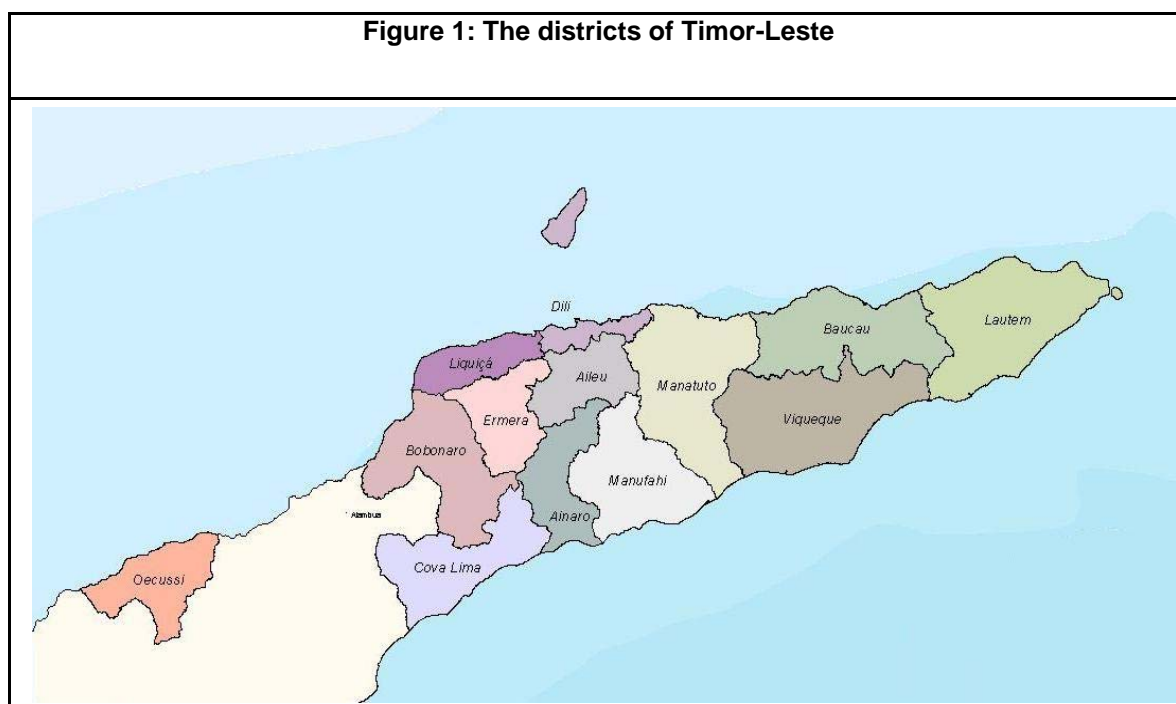

The TLSLS is the second national survey of living standards for Timor-Leste. The first national survey, the Timor-Leste Living Standards Survey (TLSS), was undertaken in 2001 during the months of August to November. The 2001 TLSS had a modest, though nationally representative, sample of 1800 households from 100 sucos covering one percent of the population. Being the first national living standards survey of its kind following the independence referendum of August 1999, the TLSS provided a wealth of information on living conditions in the country as an input into the first National Development Plan. The second national living standards survey, the TLSLS, has been undertaken to update this information and is also expected to provide an input into the development of the second National Development Plan.

It is notable that the TLSLS is a comprehensive multi-module survey. The scope of topics covered by the survey is very broad, and encompasses most of those that would be covered under more specialized surveys such as the Demographic and Health Survey, the Multiple Cluster Indicators Survey and a typical labor force survey.

The TLSLS was launched on 27 March, 2006. Unlike its predecessor, this survey was designed to run over a period of a full year in order to better account for any seasonal variation in different indicators. However, after about eight weeks of fieldwork, the survey had to be suspended due to the outbreak of conflict in the country. The survey was resumed on January 9, 2007, and survey operations have progressed without interruption since then. Fieldwork for the survey concluded on January 22, 2008. At the time of the resumption of the survey, a decision was made to revisit the households who were interviewed in 2006 prior to the interruption of the survey. In particular, 351 households had been visited in 2006. Of these, 317 households were revisited during December 2007-January 2008. The remaining 34 households could not be found at the time of the revisits, and instead an additional 41 new households were interviewed as replacement households. In order to maintain a sample for a continuous period of a year, the final TLSLS sample thus excludes the 351 households interviewed in 2006 and instead includes the 358 revisited or replaced households.

The TLSLS sample was designed to have two components: (i) a cross-sectional component of 4500 households selected with the intention of representing the current population of Timor-Leste, and (ii) a panel component of 900 households, where half of the 2001 TLSS sample of 1800 households are randomly selected and re-interviewed. The main purpose of the panel component is to evaluate changes in the living conditions for the same set of households between the two surveys. The cross-sectional component is expected to provide independent estimates for rural and urban areas of each of five recently defined groups of districts or Regions (see Figure 1):

- Region 1: Baucau, Lautem and Viqueque;
- Region 2: Ainaro, Manufahi and Manatuto;
- Region 3: Aileu, Dili and Ermera;
- Region 4: Bobonaro, Cova Lima and Liquiçá; and
- Region 5: Oecussi.

TLCLS sample design

The cross-sectional sample is selected in two stages:

- In the first stage, 300 Census Enumeration Areas (EAs) are selected as the primary sampling units (PSUs).
- In the second stage, 15 households are selected in each EA.

The design recognizes ten explicit strata – the Urban and Rural areas in each of the five regions. Table 1 shows the allocation of the 300 cross-sectional PSUs among them.

Table 1: Distribution of enumeration areas for the TLCLS cross-section sample

	<i>Number of enumeration areas</i>		
	Rural	Urban	Total
Region 1: Baucau, Lautem and Viqueque	35	25	60
Region 2: Ainaro, Manatutao and Manufahi	35	25	60
Region 3: Aileu, Dili and Ermera	35	37	72
Region 4: Bobonaro, Cova Lima and Liquica	35	25	60
Region 5: Oecussi	28	20	48
Timor-Leste	168	132	300

This particular allocation resulted from the following line of reasoning:

- In spite of their different populations and total number of households, sampling theory dictates that a sample of the roughly the same size (60 EAs) should be allocated to each region in order to produce estimates of similar quality for each of them.
- A similar case could have been made for allocating a sample of the same size (30 EAs) to urban and rural areas within each region, but since the definition of urban and rural areas outside Dili was still a matter of discussion, it was decided to opt for an allocation closer to proportional: 25 EAs in Urban areas and 35 EAs to Rural areas.
- Region 5 represents a special case. It is composed of a single district of difficult access (Oecussi, see Figure 1) that ought to be the responsibility of a dedicated team. This imposed a total sample size of 50 EAs for this region, of which only 48 can be allocated to the cross-sectional component since the panel component contains two EAs in Oecussi.
- The capacity thus liberated to visit an additional 12 EAs in the rest of the country was devoted to reinforce the urban sample in Region 3, where Dili is located.

The first sampling stage used the list of 1,163 Census Enumeration Areas (EAs) generated by the 2004 Census as a sample frame. Within each stratum, the allocated number of EAs was selected with probability proportional to size (*pps*) using the number of households reported by the census as a measure of size. No efforts were made to append the smaller EAs to neighboring EAs, or to segment the larger EAs in order to make the size of the primary sampling units (PSUs) more uniform.

The second sampling stage used an exhaustive household listing operation in all selected EAs as its sample frame. Sample households in each EA were selected from the list by systematic equal probability sampling.

As a result of the relatively large sampling fraction in some of the strata, certain large EAs were selected more than once by the *pps* procedure adopted at the first sampling stage. In fact, the cross-sectional sample only consists of only 269 (rather than 300) *different* EAs. This necessitated selecting a multiple of 15 households (rather than just 15 households) in the EAs that were selected more than once.

Definition of urban and rural areas

At the time of the 2001 TLSS, 71 of Timor-Leste's 498 sucos were conventionally qualified as urban, of which 31 sucos in the Dili and Baucau districts were qualified as major urban centers. By the time of preparation of the sample design for the 2007 TLSLS, 60 of the 498 sucos defined by the 2001 Suco Survey were conventionally qualified as urban. The partition of the country into sucos was also modified in September 2004. With the amalgamation of several sucos, the original 498 sucos were now collapsed into 442. Many of the rearrangements took place in urban areas with the result that the 60 "old" sucos are now considered urban only constitute 38 "new" sucos. Table 2 gives a list of the 60 sucos that are now considered urban.

Table 2: Names of the 60 urban sucos in 2006

District: Aileu _____ Posto: Aileu			
010110	Seloi	010113	Hurairaco
(the last two now collapsed into a single suco called Seloi Manere)			
District: Ainaro _____ Posto: Ainaro			
020101	Ainaro	020408	Maubisse
District: Baucau _____ Posto: Baucau			
030201	Tiri Lolo	030208	Caicido
(the last two now collapsed into a single suco called Tiri Lolo)			
030202	Bahu		
District: Bobonaro _____ Posto: Maliana			
040603	Ritabou	040605	Holsa
District: Covalima _____ Posto: Suai Kota

(the last three now collapsed into a single suco called Santa Cruz)			
060506	Inur Fuik	060509	Lahane Oriental
(the last two now collapsed into a single suco called Gricenfor)			
060505	Meira	060508	Bemori
(the last two now collapsed into a single suco called Bemori)			
District: Dili _____ Posto: Vera Cruz			
060604	Mascarinhas		
060605	Rumbia	(now called Caicoli)	
060602	Hanso Hatara	060607	Haksolok
(the last two now collapsed into a single suco called Vila Verde)			
060305	28 Novembro	(now called Colmera)	
060309	20 Maio	(now called Motael)	
060601	Alto Hospital	060603	Bairo Alto
(the last two now collapsed into a single suco called Lahane Occidental)			
District: Ermera _____ Posto: Ermera Kota			
070201	Poetete	070206	Talimoro
District: Liquiça _____ Posto: Liquiça			
080201	Dato		
District: Lautem _____ Posto: Lospalos			
090301	Fuiluro		
District: Manufahi _____ Posto: Same			
100301	Letefoho	100302	Babulu

Note: Each suco is identified by a geocode with 2 digits for the district, 2 digits for the posto within the district and 2 digits for the suco within the posto.

Scope of the Abstract

This Final Statistical Abstract is based on tabulations of data from the full cross-sectional component of TLSLS. The final cross-sectional sample consists of 4,477 households. Table 3 shows the distribution of the total TLSLS sample across the rural and urban areas of the five main regions in the country. The sample can be considered representative at national level as well as at the level of the ten domains represented by the rural and urban areas of the five regions.

	Rural	Urban	Total
Region 1 : Baucau, Lautem, Viqueque	524	375	899
Region 2 : Ainaro, Manatuto and Manufahi	517	374	891
Region 3 : Aileu, Dili and Ermera	522	552	1,074
Region 4 : Bobonaro, Cova Lima and Liquiçá	520	375	895
Region 5 : Oecussi	419	299	718
Timor-Leste	2,502	1,975	4,477

The fieldwork was designed to be more or less evenly spread throughout the country over the year. Given the challenges of the turbulent political and security situation during some periods in 2007, the fieldwork schedule had on occasion to be modified a bit to accommodate concerns of security and feasibility of fieldwork. Despite this, as seen in Table 4, the distribution of the sample by month of interview and by region and rural and urban areas indicates a sample that is well-spread through the year, which should allay any concerns of intra-year seasonality.

	Region 1: Baucau, Lautem and Viqueque	Region 2: Ainaro, Manatuto and Manufahi	Region 3: Aileu, Dili and Ermera	Region 4: Bobonaro, Cova Lima and Liquiçá	Region 5: Oecussi	Timor-Leste
January 2007	60	90	75	87	58	370
February	91	60	75	90	45	361
March	75	59	105	45	60	344
April	58	45	45	60	45	253
May	75	132	90	135	75	507
June	60	74	105	88	60	387
July	60	74	164	60	60	418
August	45	119	58	60	60	342
September	60	88	90	45	60	343
October	120	30	89	75	76	390
November	105	60	90	45	59	359
December 2007	60	45	45	60	30	240
January 2008	30	15	43	45	30	163
Total	899	891	1,074	895	718	4,477

This Statistical Abstract presents tabulations on nine main topics drawn from the corresponding sections of the TLSLS questionnaire. The topics covered include: demographics, housing, access to facilities, durable goods, education, health, employment, social capital and subjective well-being. A set of key tables are presented for each topic. The Abstract however does not aim to present an exhaustive tabulation of the all the data for any topic. Moreover, besides these topics, there are many others;

Three variants of each key table are presented:

- The first presents estimates at the national level, for rural and urban areas, and for each of the five regions.
- The second presents separate estimates for rural and urban areas within each of the five regions.
- The third presents estimates for each of the 13 districts.

A special feature of the Abstract is that it exploits the similarity of the 2001 TLSS and 2007 TLSLS survey instruments to also present comparative estimates for 2001 at the national level. Exactly the same methodology is applied in computing the 2001 numbers as used for the 2007 estimates. The 2001 estimates are intended to provide some notion of the change in various indicators over the last six years. However, no attempt is made in this Abstract to explain the observed changes. An explanation of these changes requires deeper and a more complex level of analysis that is beyond the limited scope of this Abstract. It is hoped that the findings presented in this Abstract will spur more detailed analysis.

Further care should be taken in comparing the 2001 and 2007 estimates. While the questionnaire for the 2007 TLSLS mirrors that for the 2001 TLSS for the most part, there are some differences in particular instances due to the adaptation of the survey instrument to the new realities which may influence the comparability of results. The notes to the tables also alert the readers to some variations in survey instruments where relevant.

Selection probabilities and raising factors

For the cross-sectional sample of TLSLS, the selection probabilities and raising factors are determined in accordance with the sample design described above.

The probability of selecting Census Enumeration Area ij in stratum i is

$$p_{ij} = \frac{m_i n_{ij}}{n_i} \quad (1)$$

where n_{ij} is the number of households in the EA (as reported by the 2004 Census), n_i is the total number of households in the stratum (also as per the 2004 Census) and m_i is the number of EAs selected in the stratum.

The probability of selecting household ijk in EA ij of stratum i is

$$p_{ijk} = p_{ij} \frac{15}{n'_{ij}} \quad (2)$$

where n'_{ij} is the number of households in the EA, as per the household listing operation.

The raising factor or weight w_{ijk} for household ijk is the inverse of the selection probability p_{ijk} . If the number n'_{ij} of households found at the time of the listing operation were equal to the number n_{ij} recorded by the census in all EAs, the sample would be self-weighted in each stratum, with a constant raising factor equal to $n/15m_i$. In practice the numbers n_{ij} and n'_{ij} will seldom be equal but often close to each other, meaning that the samples will not be exactly self-weighted, but quite approximately so.¹

The household weights are further adjusted such that the population totals as estimated from the full sample match the demographic projections for mid-2007 for each stratum. This corresponds to a mid-2007 total population for Timor-Leste of 1,047, 632 persons.²

Standard errors and confidence intervals

The statistics presented in this Abstract are based on a sample of the population and thus have sampling errors associated with them. For reasons of space, the Abstract does not report any standard errors or confidence intervals for the statistics. However, to illustrate the margin of error associated with the reported statistics, Table 5 shows the standard errors and 95% confidence intervals for the net primary enrolment rates for the academic year 2006/7, which is one set of the tables presented in the Education section of the Abstract.

In computing these standard errors and confidence intervals, the particular features of the TLSLS sample design have been taken into account. As discussed above, the TLSLS is not a simple random sample of the population in Timor-Leste, but follows a stratified two-stage sampling design. In particular, the sample design involved defining ten strata, selecting a number of primary sampling units (PSUs) within each stratum at the first stage, and then selecting households from each PSU at the second stage. Thus, the computation of standard errors and confidence intervals takes into account three key features of the survey design: strata, primary sampling units and sampling weights. These design features imply that the standard errors of TLSLS-based statistics will be different to those that can be expected from a simple random sample. (see table overleaf)

¹ Strictly speaking, the above formulae are valid only when the size of the EA is such that it can be selected at most once by the *pps* procedure. However, the artifact of selecting $15t$ households in the second stage whenever an EA is selected t times in the first stage has the effect of making them applicable to compute raising factors even for the large EAs where that may not be the case. Formula (2) may be inadequate if the actual size n'_{ij} of EA ij happens to be less than 15. In that (quite unlikely) case, all households in the EA will need to be visited, and p_{ijk} simplifies to p_{ij} .

² This population total relates to the medium-level projection in DNE (2007), Population Projections 2004-2050: Analysis of Census Results, Report 1, General Population Census of Timor-Leste 2004.

Table 5: Standard errors and confidence intervals of net primary enrolment rate for the academic year 2006/7

	Net enrolment rate	Standard error	[95% confidence interval]	
			Lower bound	Upper bound
National	65.62	1.86	61.96	69.29
Rural	62.26	2.41	57.51	67.00
Urban	74.28	2.79	68.79	79.77

Region 2: Ainaro, Manufahi, Manatuto	72.17	3.56	65.16	79.18
Region 3: Aileu, Dili, Ermera	61.77	3.59	54.70	68.83
Region 4: Bobonaro, Cova Lima, Liquiçá	64.01	4.05	56.04	71.99
Region 5: Oecussi	52.48	3.11	46.35	58.61
Region 1 rural	71.42	3.46	64.61	78.22
Region 1 urban	71.50	2.64	66.31	76.69
Region 2 rural	72.82	4.18	64.59	81.05
Region 2 urban	69.00	4.11	60.91	77.10
Region 3 rural	38.30	5.11	28.24	48.37
Region 3 urban	76.61	3.88	68.98	84.24
Region 4 rural	63.79	4.55	54.84	72.74
Region 4 urban	65.46	7.09	51.50	79.42
Region 5 rural	50.14	3.44	43.38	56.91
Region 5 urban	76.13	4.20	67.87	84.39
Aileu	39.72	7.92	24.14	55.31
Ainaro	70.51	4.44	61.76	79.25
Baucau	67.96	3.33	61.41	74.51
Bobonaro	72.35	4.81	62.89	81.81
Cova Lima	77.37	5.62	66.30	88.44
Dili	79.84	3.05	73.84	85.85
Ermera	33.12	4.40	24.45	41.78
Lautem	77.52	5.32	67.04	88.00
Liquiçá	44.01	4.84	34.49	53.53
Manufahi	65.88	9.06	48.06	83.70
Manatuto	79.55	5.92	67.89	91.21
Oecussi	52.48	3.11	46.35	58.61
Viqueque	67.62	3.95	59.85	75.39

The standard errors and confidence intervals in Table 5 have the standard interpretation. While the statistics on net enrolment rates are unbiased, the standard errors give a measure of the dispersion for the statistic in question. The lower and upper bound of the 95% confidence intervals give the range within which the statistic in question can be expected to lie with a 95% probability. A particular feature of the estimates in Table 5 is worth highlighting, namely, the standard errors and confidence intervals become larger for statistics at successively lower levels of disaggregation. Thus, standard errors are lowest and the confidence intervals are narrowest for the national primary net enrolment rate indicating that national-level indicators (which are based on the entire sample) are the most precisely estimated. However, as we move from national to rural-urban to regional and stratum level net enrolment rates the standard errors and confidence intervals become larger. In particular, the confidence intervals are largest at the district level, which carries the important implication that district-level statistics reported in this Abstract should be interpreted cautiously in view of their relatively lower degree of statistical precision.

Future uses of TLSLS data

Notwithstanding the larger number of tabulations presented in this Abstract, it only scratches the surface of the wealth of information that the TLSLS contains. Some of the anticipated uses of the TLSLS data include: the monitoring of several of the Millennium Development Goals, an assessment of poverty in the country, information for components of National Accounts, and updating of the weighting diagram for the Consumer Price Index, just to name a few. Beyond these, the data from the TLSLS will also enable further detailed analysis of sectoral issues, and indeed provide an important input for the Second National Development Plan, and evidence-based policy making for Timor-Leste more generally.

1. Demographics

Concepts and definitions

This section describes selected characteristics of the population of Timor-Leste. The demographic profile includes the population structure by gender and age groups as well as the distribution of the population by marital status, mother tongue, languages spoken and main occupations. Tabulations of the population that has been away from their household for more than a month in the last year are also included.

The prevalence of orphans and living arrangements of children are reported for all children under 15 years old. The prevalence of orphans refers to the proportion of children that have lost one or both parents. The living arrangements of children indicate whether a child is living with none of his or her biological parents, with only one or with both of them.

The TLSLS captures the population living in private households. A household is a group of persons (or a single person) who usually live together and have a common arrangement for food, such as using a common kitchen or a common food budget. The persons may be related to each other or may be non-relatives, including servants or other employees, staying with the employer. Students and employees residing in and having a common food arrangement with the household are considered members of the household if they have been in the household for the last year and absent for no more than one month. If absent for longer than nine months, only infants less than three months old, newly weds or a bride who has joined her husband's family are considered household members.

However, this does not include boarders/lodgers or boarding houses operated by the household. Boarding houses with more than five persons are considered to be institutional households. Institutional households are not covered by the survey. They are defined as a group of five or more unrelated persons living together, for example, those living in boarding houses, military barracks, prisons, or student dormitories.

2. Housing

Concepts and definitions

This section provides information on housing conditions in Timor-Leste. The tabulations depict the type of existing dwellings, their main characteristics, the ownership status of the residence, and the availability of utility services such as water, sewage, electricity and communications.

A dwelling could be an entire building or a part of it. It is designed for the living of one or more households, regardless of the status of occupation. It has walls and a ceiling, and consists of one or more rooms with their accessories. Deserted buildings unsuitable for human occupation do not qualify as dwellings.

A room is a dwelling or part of it, surrounded by walls, having a ceiling and used for the purposes of sleeping, sitting, dining or studying. The kitchen is considered a room if used for sitting or sleeping in addition its use as a kitchen. A bathroom, toilet, corridor, veranda or balcony does not qualify as room.

Drinking water from an improved water source refers to tap or bottled water, or water from a pump or a protected well or spring, while unimproved sources include water from unprotected wells and springs, rivers, streams, lakes, ponds, and rainwater. Treatment of drinking water refers to various methods employed by the household to make the water safe for drinking. The water could be boiled, filtered or treated with chemicals.

Basic sanitation indicates access to improved sanitation facilities such as adequate sewage disposal facilities (private or shared but not public). They comprise pit latrines, flush toilets and septic tank as the means of final disposal of sewage.

Access to electricity is measured in terms of public or privately generated electricity as the main source of lighting in the dwelling.

n.a. Option not available in 2001.

a/ Access to an improved water source refers to household water connection, public standpipe or protected well or spring.

Unimproved sources include vendors, tanker trucks and unprotected wells and springs.

b/ It may refer to either boiling, filtering or adding chemicals.

c/ Sanitation refers to access to improved sanitation facilities such as adequate excreta disposal facilities (private or shared but not public).

They comprise pit latrines, flush toilets and septic tank as the means of final disposal of sewage.

d/ Public or privately generated.

3. Access to Facilities

Concepts and definitions

This section describes the availability and use of several types of facilities by the population across the country. The list of facilities encompasses educational institutions, clinics, banks, bus terminals, post offices, veterinary centers, vocational centers and police stations. The tabulations report the percentage of population normally using the facility, and the average distance and travel time to the facility. The distance and travel times are only reported for population using the facility.

The section also reports on the distance to the nearest vehicle passable road from the household, whether it is accessible during rainy season, the main reasons for using the road, and the frequency of use.

T3.1

4. Durable Goods

Concepts and definitions

This section provides information on a variety of durable goods owned by the population. The scope of durable goods is restricted to those intended for household consumption, and not for business or production purposes. These consumer durables are expected to yield services and utility to the household over a number of years.

The durable goods covered by the survey mostly consist of household appliances such as stoves, refrigerators, sewing machines, fans, washing machines, radios, stereos, and television sets, but they also include bicycles, scooters, motorcycles, cars, and motorized and non-motorized boats.

5. Education

Concepts and definitions

This section provides evidence on educational outcomes and various aspects of the use of educational services by the Timorese population. A large number of topics are covered including the highest level of schooling attained by the adult and youth population; completion rates of primary, pre-secondary and secondary; reading and writing ability of the adult population; school participation rates; primary, pre-secondary and secondary enrolment rates; profile of students attending school and the distribution of those currently out of school; population that has never attended school and the reasons for non-attendance. Several of the tabulations are presented for the academic year 2004/05 as well as for the academic year 2006/07 as the survey contains information about both years.

The highest level of educational attainment for the adult (18 years and older) and youth (16-30 years) population refers to the most advanced level they have completed in the educational system. The levels considered are none, incomplete primary, complete primary, incomplete pre-secondary, complete pre-secondary, incomplete secondary, complete secondary, academy/university, and vocational/non-formal. Complete primary refers to those who have completed primary school but have not done even a single year of pre-secondary. Complete pre-secondary refers to those who have completed pre-secondary but have not done even a single year of secondary. Complete secondary refers to those who have completed secondary but have not done even a single year of post-secondary education. If a particular level is not completed, the figures show the percentage of the relevant age group that have successfully done at least one year of that level.

On the other hand, the level of schooling for those attending a particular academic year just refers to the level of education in which students were enrolled in that academic year. And overall school participation for 2006/07 (2004/05) denotes whether a person attended any educational level during 2006/07 (2004/05).

Completion rates for primary, pre-secondary and secondary refer to the percentage of the population that has completed each level of schooling. In the case of primary, it is estimated for those 12 years and older; for pre-secondary among those 15 years and older; and for secondary among those 18 years and older. Two sets of completion rates are reported: one for all the population in the respective age group and another for all the population in the respective age group that ever attended school.

Reading and writing ability refers to the ability to read and/or write a letter in the language spoken in the household. The reading/writing ability is as self-reported by household members; no literacy tests were administered during the survey.

Net and gross enrolment rates are calculated for the three main educational levels: primary, pre-secondary and secondary.¹ The relevant age group for primary is those ages 6 to 11 years, for pre-secondary those ages 12 to 14 years, and for secondary those ages 15 to 17 years. The gross enrolment rate for a certain level is the ratio of the number of students attending that level irrespective of their age to the total number of children in the relevant age group for that level. The net enrolment rate for a certain level, on the other hand, is the ratio of the number of students in

¹ The terms enrolment rates and attendance rates are sometimes used to emphasize the source of the data: administrative records or self-reported attendance to school. In this report, enrolment rates refer to self-reported attendance to school.

the relevant age group attending that level to the total number of children in the relevant age group for that level. In other words, while the denominators for the gross and net enrolment rates are the same, the numerator for the net enrolment rate is smaller as it excludes both under-age and over-age pupils for any given level of education. Over-age students are the most important reason for net enrolment rates to be smaller than the gross rates, and they reflect the problems of late starters, repeaters, and others who have had some interruption in their educational progression.

An important element in the estimation of the enrolment rates is the evaluation of the age of children in constructing the relevant age groups for different levels of education. For the latter, we need to invoke the concept of the “right” age for a particular level of education based on current educational guidelines and the timing of the academic year, in particular, the following:

- The academic year typically runs from September to July.
- By his or her 6th birthday, a child is expected to be in the first grade of primary school, by the 12th birthday in the first grade of pre-secondary, and by the 15th birthday in the first grade of secondary school.

In light of the above, rather than using the age of the child on the day of interview, his or her age at the beginning of the academic year was calculated. Thus, for enrolment rates and school participation for 2004/05, the child’s age on September 1, 2004 was calculated by subtracting from their current age the difference between the date of interview and September 1, 2004. Similarly, for enrolment rates and school participation for 2006/07, age as on September 1, 2006 was estimated, and an analogous procedure was also used for these two indicators based on the 2001 TLSS.

A significant caveat relating to a particular feature of the education module of the questionnaire should be mentioned because it will affect some of the findings. In the education module, if a person had ever attended school, she was asked about attendance in the academic year 2004/05. If the response was positive, this person provided information about that academic year and also about attendance in the current academic year (2006/07 or 2007/08).² If however the person did not attend the academic year 2004/05, she would only report her highest grade completed in school, and further questions about current attendance were not asked. This feature of the questionnaire has practical implications for some of the indicators. First, in the case of the highest educational attainment of the adult population, there are around 2% of those aged 18 years and more for whom the level reported may not be the highest. If someone did attend school during 2004/05 but she was currently not attending, the information refers to the level attended in 2004/05. However, it is not possible to know, for instance, if this person enrolled in 2005/06, studied an additional year and then did not enroll in 2006/07. Second, in the case of attendance for the academic year 2006/07, there are around 5.9% of those ages 5 to 17 years for whom it is not possible to know whether they are currently attending or not. These children did not attend school in 2004/05 but may have been enrolled in 2006/07. Thus, all indicators for the academic year 2006/07 are conditional on having attended 2004/05 and exclude the 5.9% of children for whom it is not possible to know their current attendance.

² The focus on the academic year 2004/05 reflects the original timing of the survey, which was intended to take place during 2006, and thus 2004/05 would have been the last complete academic year. However, even though the survey started in April 2006, fieldwork had to be suspended in May 2006 due to the outbreak of conflict in the country. The survey was only resumed in January 2007, but kept collecting information about 2004/05 and the current academic year, which since the resumption of the survey referred to the academic year 2006/07 or 2007/08 (rather than 2005/06 as originally intended). While all the population that ever attended school provided information about the academic year 2004/05, those interviewed from January 2007 to August 2007 reported for the 2006/07 academic year, and only those interviewed from September 2007 to January 2008 reported for the 2007/08 academic year. Hence, neither enrolment rates nor school participation rates are reported for the 2007/08 academic year.

6. Health

Concepts and definitions

This section reports on the current status of both the population's health and aspects of the coverage and performance of the health system in the country. It presents tabulations on a wide range of indicators and outcomes including: self-reported morbidity rates (the proportion of the population reporting health complaints in the last 30 days), visits to a health care facility in the last month, access to health care providers in the last 12 months, purchases of medicines without prescription, hospitalizations in the last year, the use of mosquito nets as a means of preventing malaria, immunization rates against diphtheria, pertussis, and tetanus (DPT), tuberculosis (BCG), poliomyelitis, measles and vitamin A supplementation among children less than 5 years old, fertility, antenatal care and assisted deliveries, immunization against tetanus toxoid, birth registration of children, contraceptive prevalence and knowledge of HIV/AIDS.

It provides anthropometric indicators of the nutritional status of children less than 5 years old. Following common practice, three anthropometric indices are reported based on weight and height measurements of children and their age. Anthropometric measurements were carried out in the field using the following methodology:

- **Weight.** If the child was able to stand unattended, he/she was weighed alone. If he/she was too young or required assistance, the mother was weighed first, the weight noted, and then the mother and child were weighed together, and the mother's weight was subtracted to get the final weight of the child. Weight was measured to the nearest 100 grams.
- **Height.** If the child was under two years of age, the height was measured with the child lying down barefoot on the measurement board. If the child was over two years of age, his/her height was measured standing barefooted with their back against the measurement board. Height was measured to the nearest millimeter.

The three anthropometric indices relate to weight-for-age (W/A), height-for-age (H/A) and weight-for-height (W/H). Low values of these indices indicate different aspects of child malnutrition. Height-for-age reflects achieved linear growth relative to age. Low H/A, or stunting, is indicative of long-term deficiencies in nutrition and/or poor health. Weight-for-height reflects the body mass relative to height. Low W/A, or wasting, is indicative of weight loss or insufficient weight gain relative to height, and may be the consequence of starvation or severe disease (in particular diarrhea), but it can also be due to chronic conditions. Weight-for-age is an indicator of body mass relative to age, and is influenced by both sets of factors determining weight-for-height and height-for-age. Low W/A, or being underweight, can be interpreted as a general indicator of child health and mortality risk.

These anthropometric indices are calculated by comparing the age, gender, weight and height of each child with those of a reference population set by the World Health Organization. The indices, calculated separately for the H/A, W/H and W/A indicators, are expressed as z-scores, which are defined as the deviation of the value of the indicator for an individual child from the median value for the reference population (for the corresponding gender and age), divided by the standard deviation for the reference population (for the corresponding gender and age). Children who are more than two standard deviations below the reference population (z-score <-2) are considered undernourished (stunted, wasted or underweight), while those more than three standard deviations below the reference population (z-score <-3) are considered severely undernourished (severely stunted, severely wasted or severely underweight). The tabulations report the prevalence rates for child malnutrition in terms of the percentage of under-5 children who are either undernourished or severely undernourished.

Lastly, this section also reports on the iodized salt consumption of the household. An adequate iodized salt contains 15 parts per million (ppm) or more of iodine. Iodine deficiency is one the main causes of preventable mental retardation. Severe deficiencies cause cretinism, stillbirth and miscarriage, while even mild deficiency can significantly affect the learning ability of the population.

² The estimation was done with the Stata version of the WHO Anthro 2005 software, which incorporates the latest WHO child growth standards.

7. Employment

Concepts and definitions

This section presents a range of indicators on labor market and employment conditions in Timor-Leste.

The tabulations on labor force participation and unemployment follow the standard International Labor Organization approach to measurement of these indicators. In particular, the tabulations focus on the population ages 15 to 64 years and use the last 7 days previous to the interview as the reference period. The labor force is defined to comprise all economically active persons either currently employed or unemployed. The former includes those who worked in the last week for at least one hour as well as those who did not work in the last week but have a permanent job. The unemployed comprise those who did not work in the last week, did not have a permanent job and were looking for work. In addition, the unemployed also include those who did not work in the last week, did not have a permanent job, did not look for work, but were waiting for a reply from an employer, waiting for a recall from an employer or waiting for the busy season. The unemployment status thus defined does not capture the phenomenon of discouraged workers who while not having worked during the past 7 days also did not look for a job as they saw no prospect of finding any work.

The population out of the labor force comprises those who were neither employed nor unemployed during the last week. They represent those who were not economically active for a variety of reasons including attendance to an educational institution, engagement in household duties, retirement, old age or disability.

The labor force participation rate refers to the proportion of people in the labor force in the total population ages 15 to 64 years, whereas the unemployment rate refers to the share of the unemployed in the total labor force.

The employed comprises those working in wage employment, non-wage employment and farming. Wage employment, or paid employment, refers to all persons performing some work for wage or salary, in cash or in kind. Non-wage employment, or self-employment, refers to all persons performing some work (other than farming which is identified separately) for profit or family gain, in cash or in kind. Farming refers to all persons working in agriculture, livestock, forestry or fishing.

The main job refers to the job in which the person worked the most hours during the last week.

Tabulations are also presented on the amount of time spent on various housework and caregiving activities during the last 7 days. Specifically, five such activities are identified: fetching water; fetching wood; performing household chores such as cooking, cleaning, washing clothes or doing maintenance work at home; watching over young children; and caring for the elderly.

8. Social Capital

Concepts and definitions

This section presents some evidence on the state of social capital in the country, i.e., the reach of existing groups, associations and networks that facilitate collective action. Six main types of groups/networks are identified, namely, those relating to farming, health, education, women, youth, credit and a residual category of “other” groups. The basic indicators consider the extent of participation of the population in any of these six main groups/networks over the previous year, any membership fees paid by the household to participate in these groups, and the frequency and attendance of meetings held by the group/network over the past three months.

9. Subjective Well-being

Concepts and definitions

This section gives information on self-reported perceptions of own welfare by the Timorese population. It covers different aspects of subjectively-assessed well-being including perceived adequacy of household income, satisfaction of basic needs, food security and a comparison with the household's living conditions in 2001.

The basic needs dimension relates to the adequacy over the past month of the household's food consumption, and the household's situation with respect to housing, clothing, health and children's education.

The tabulations on food security present evidence, in terms of the households' own assessment, on the number of months over the previous year the households experience low overall food consumption or inadequate consumption of staples (rice or maize). Evidence is also presented on various strategies that household resort to in coping with the inadequate availability of food.

These assessments of subjective well-being reveal important information on how households perceive the state of their own living conditions. They are however conceptually different to "objective" measures of poverty and human development that are based on the measurement of observable indicators such as household consumption, educational attainment or specific health outcomes. In particular, self-assessments are influenced by the conditions of other households that the household may compare itself with, or by the household's own situation in the past.
