What is cybercrime?

According to the different international bodies discussing the subject, **cybercrimes are mainly offenses in which the criminal makes an attack on information about individuals, corporations, or governments.**¹ The INTERPOL defines cybercrimes are those committed “*against computers and information systems*, where the aim is to gain unauthorized access to a device or deny access to a legitimate user”.² In the same way, EUROPOL clarifies that *data is the key element* for all cybercrimes and their main target.³

What are examples of cybercrimes?

The Council of Europe Convention on Cybercrimes classifies cybercrimes in 4 main categories: offences against the confidentiality, integrity and availability of computer data and systems (title 1); computer-related fraud and forgery (title 2); child pornography (title 3) and infringements of copyright and related rights (title 4).⁴

Specific examples of cybercrimes are:

- Email and internet fraud;
- Identity fraud (where personal information like identity or social security number, is stolen and used) – including false Facebook ID using someone else identity;
- Theft of financial or card payment data;
- Theft and sale of corporate data;
- Cyberextortion (demanding money to prevent a threatened attack or to release illegally obtained digital information);
- Trafficking in child pornography;
- Ransomware attacks (a type of cyberextortion in which hackers hijack the data of an organisation, e.g. a company or a hospital, blocking their access, and demand the payment of a ransom to release the data and if the victim denies, they threat to erase everything);
- Cyberespionage (where hackers access government or company data);
- Cyberterrorism.
